

1. AI Engineering Intern - MDI (Mission-Critical Software)

Most Important Quality: Practical Technical Execution. The employer explicitly states this is a "build-and-ship role, not a research internship." They value a candidate who can move past theoretical AI and actually deploy functioning agents that reduce manual labor.

Work Environment: High-stakes and Fast-paced. Because the software is "mission-critical" for the insurance industry and involves direct exposure to executive decision-making, the environment is likely professional, accountable, and results-oriented.

Negotiables: Specific Framework Knowledge. While they prefer LangChain or LlamaIndex, they likely would negotiate on these specific tools if a candidate has a strong Python/JavaScript foundation and a demonstrated ability to build working software.

2. Junior Technical Writer - Siemens (Energy/Tech Sector)

Most Important Quality: Information Synthesis. The core need is taking engineering data and making it digestible for field technicians. They want someone who can bridge the gap between expert speech and practical application.

Work Environment: Structured and Safety-Oriented. Industrial tech companies usually have strict documentation standards and hierarchical review processes. It's likely a stable, methodical environment.

Negotiables: Industry Background. They likely don't expect a student to know the ins and outs of power grid software, provided they have a portfolio that proves they can write clearly about complex topics.

3. Business Analyst Intern - AdventHealth (Healthcare Systems)

Most Important Quality: Data Literacy. They need someone to look at workflows and find efficiencies. The emphasis is on "measurable improvements," requiring a candidate who is comfortable with both people and spreadsheets.

Work Environment: Mission-Driven and Collaborative. Healthcare environments focus heavily on the end-user (the patient/provider), meaning the culture likely prioritizes empathy and clear communication across departments.

Negotiables: Software Specifics. If you don't know their specific CRM or EHR system, they will likely train you as long as you have strong logic and workflow automation experience.

Position Choice: AI Engineering Intern at **MDI**.

Rationale: I chose this position because it offers a rare opportunity for real production deployment rather than just academic research. My strongest qualification is my **ability to bridge the gap between technical development and internal training**. As the role requires acting as a "Subject Matter Expert" for non-technical teams, my background in computer science allows me to build the software while also documenting the processes for the operations and sales teams.
